Storage Instructions for CA Glue.

To maximize the shelf life of "CA" glues, we recommend the following:

Once a bottle of CA glue has been opened, it is important that it be kept upright and not exposed to extreme heat or cold, and most especially, dampness or water.

Find a jar with a tight fitting lid. This jar may be either plastic or glass. Use the change-a-tip package to replace the tip that comes on the bottle with a change-a-tip cap and stopper. Once you use the replacement tips that come in the change-a-tip package, it is recommended that you place these tips in a small bottle of Acetone for storage and cleaning.

Place the bottle in the jar along with a dry pack, which will have a blue color to the package and seal the jar. Keep an eye on the color of the dry pak, as it will change to a pinkish color when it has absorbed all of the moisture that it can. When this happens, place the dry pak in a microwave for a couple of minutes to allow it to dry out, and the color will change back to the bluish color. It can then be re-used.

You can place more than one bottle of the CA glue in the jar. **It is extremely important not to place either the accelerator or the debonder in this jar with the glue**, as if any type of leak were to develop in these products, it will ruin the glue in the jar.

This procedure will maximize the life of your product. Do **NOT** store CA glue in the refrigerator as the normal moisture in the refrigerator will ruin the glue.

Properly stored, CA glues will last a long time.
